New Segments

Our experience in the consumer goods industry, the glass and wood industry and the renewable energy field demonstrates the versatility of our automated solutions, **with or without integrating robots.**

However, it is also worth optimising the handling processes using flexible robots. They reliably relieve people and machines from demanding tasks such as loading and unloading processes, stacking, assembling, palletising, and quality control tasks, all without human support. Even sawing, planing, drilling and coating can now be easily performed by modern robots.

They can be used in wide-ranging applications, are flexible and low-maintenance all-rounders and combine high loads with rapid and simple programming. They help your company achieve a quick yet precise production sequence.

As required, Krüger Industrieautomation GmbH will collaborate with you to develop **the optimum automation solution.** Our cost-effective refurbished robots help to reveal ways to flexibly increase your production and substantially reduce your costs at the same time.
